                                                                                                                                  The present invention describes a short interfering nucleic acid (siNA) CC that downregulates expression of a protein kinase C-alpha (PKC-alpha) CC gene by RNA interference. Also described: (1) a siNA that modulates CC expression and/or activity of genes for other isoforms of PKC or genes CC involved in the PKC pathway; (2) kits for in vitro or in vivo delivery of SiNA; (3) conjugates and/or complexes of siNA; and (4) vectors that CC express siNA. The siNA sequences have cytostatic, vasotropic and CC express siNA. The siNA sequences have cytostatic, vasotropic and CC of expression of the PKC-alpha gene by RNA interference. The siNA can be useful in treating a variety of cancers including e.g. breast cancer, CC cancers of the head and neck, ovarian cancer, lung cancer, prostate CC cancers of the head and neck, ovarian cancer, lung cancer, prostate CC cancers of the head and for treating other proliferative diseases CC and conditions, such as restenosis and polycystic kidney disease. The SiNA may also be useful for diagnosis, drug screening, target condition, and for gene mapping (e.g. of single-nucleotide polymorphisms). CC The present sequence represents a human PKC-alpha siNA target, which is CC used in the exemplification of the present invention.

                                                                                                                                                                                                                                          RESULT 2966
                                                                                                                                                                                                                                                                                                                                                                                                                                CC The present invention describes a short interfering nucleic acid (sina) CC that downregulates expression of a protein kinase C-alpha (PKC-alpha) CC gene by RNA interference. Also described: (1) a sinA that modulates CC expression and/or activity of genes for other isoforms of PKC or genes CC involved in the PKC pathway; (2) kits for in vitro or in vivo delivery of CC sinA; (3) conjugates and/or complexes of sinA; and (4) vectors that CC express sinA. The sinA sequences have cytostatic, vasotropic and CC of expression of the PKC-alpha gene by RNA interference. The sinA can be useful in treating a variety of cancers including e.g. breast cancer, CC cancers of the head and neck, ovarian cancer, lung cancer, prostate cancer, and glioblastoma and for treating other proliferative disease. The sinA may also be useful for diagnosis, drug screening, target conditions, such as restenosis and polycystic kidney disease. The condition, and for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a human PKC-alpha sinA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                 吊
                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a short interfering nucleic acid (siNA) CC that downregulates expression of the SCD (stearcyl-CoA desaturase) gene CC by RNA interference. Also described: (1) modulating expression of SCD CC genes in cells, tissue explants or organisms by introduction of siNA; (2) conjugates in vitro or in vivo delivery of siNA; (3) conjugates and/or CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting CC siNAs have anorectic, antidiabetic, antiarceriosclerotic, cytostatic and CC virucide activities. The siNAs can be used to modulate expression of SCD CC genes, in cells, tissue explants or organisms, e.g. for treating obesity; CC diabetes (types I and II); atherosclerosis; cancer and viral infections. CC identification and validation; genetic engineering; pharmacogenomics; cudying gene function and gene mapping (e.g. of single-nucleotide cc polymorphisms). The present sequence represents an SCD siNA, which is constructed the complification of the present invention.
                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a short interfering nucleic acid (siNA) CC that downregulates expression of the SCD (stearcyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD CC genes in cells, tissue explants or organisms by introduction of siNA; (2) CC kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or CC complexes of siNA; and (4) vectors that express siNA. SCD inhibiting CC siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD CC genes, in cells, tissue explants or organisms, e.g. for treating obesity; CC diabetes (types I and II); atherosclerosis; cancer and viral infections. CC identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide CC polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Probe was labelled with gamma-32P-ATP and polymucleotide kinase. It was used together with pool LF2 (AAN81958) for screening libraries. See also AAN81956-N81958; esp. AAN81958. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This oligonucleotide and its analogue, having phosphorothicate bonds, were designed to specifically bind to the gag-pol frameshift region and interfere with translation and/or frameshifting. There is potential for significant RNA secondary structure near the site of frameshifting in HIV 1. The inhibitory effect of the oligo and its analogue has not yet been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MOdulating gene expression for HIV treatment - comprises binding oligonucleotide(s) to RNA portions which have sec. structure.
                                                              This PCR primer was used with AAQ29645 to detect the presence Hepatitis C viral RNA in a sample. (Updated on 25-MAR-2003 to field.)

                                                                                                                                                                                                                                                                             The sequences given in AAQ24460 and AAQ24461 are PCR primers which are used to amplify the 5' region of non-A, non-B hepatitis virus (NAMBHV) strain HC-J5. These probes amplify the region corresponding to nucleotides 867-1354 of the entire nucleotide sequence and were used to produced clones C5164, C5303 and C5331. The nucleotide sequences derived from this amplification can be used to detect NAMBHV infection which could not be detected by conventional methods. The detection kits allow highly specific and sensitive detection at an early phase of infection
                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant cDNA of NANBH virus strain HC-J5 and corresp. peptides - useful for diagnosis and in vaccines and immunological pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-A.
non-B hepatitis virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of PCR primer #55 which was used to determine the 5' terminus sequence from nucleotides 867-1354 of non-A, non-B hepatitis (NANBH) virus strain HC-J5. These nucleotide sequences encode structural proteins of NANBH virus and these proteins can be analysed to locate and provide polypeptides useful as antigens for detection of NANBH virus via antibody-antigen complex detection. Mutants, variants or fragments of the sequence can be used for very sensitive detection. (Updated on 25-MAR-2003 to correct PN field.)

                                                                  AAQ74282 and AAQ74283 are the forward and reverse PCR primers for human amyloid precursor protein (ApP) exon 14, these were used to screen yeast artificial chromosome (YAC) libraries for APP. Isolated APP clones were then injected into blastocysts, from the same species as the embryonic cells which contained the YAC library. Transgenic animals which could be used as models of beta-amyloidosis (prevalent in individuals with Down's syndrome and Altzheimers disease), were then generated from the injected blastocysts. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                      Synthetic.
                                                                                                                                                                                                                                 /note= "at least one (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the nucleosebe being stratched covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl
```

New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide consist of hackbone and (b) hybridise to the translation initiation AUG region, 5 (cuntranslated region (5 UTR), 3 untranslated region (3 UTR), splice concerns or coding sequence of a human immunodeficiency virus gene concerns from env, gag, pol, rev and tat. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene concerns for the processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as createrch tools. PNA oligomers have high affinity for complementary single cresent translated DNA. They are also able to form triple helices in which a first CNA strand binds with RNA or ssDNA and a second PNA strand binds with the creater soluble, which facilitates cellular cuptake. Further, since they contain anddes of non-biological amino acide, they are biostable and resistant to enzymatic degradation by proteases. CC The present sequence is a specifically claimed PNA sequence (represented CC by the sequence of nucleobases) targetting the HIV gag/pol frameshift. Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS.                                                                                                                                        Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as means of diagnosing abnormal cell function or for recognising different cell types. The primers T41211-2 amplify clone pm0647 which comprises the GS HUMGS001132 (T20132), located on chromosome 20
                                                                                                                                                                                                                                                                                                                                                        Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. _{\rm mRNA} in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; primer; PCR; amplification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAT41212 standard; DNA; 20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           translation termination. The second mutation is a G to A substitution at a splice donor site. The mechanism of how this mutation causes factor XIII deficiency is yet to be determined. The third mutation is a nonsense mutation in which a C to T transition at position 598, in an Arg codon, results in a stop codon TGA. A further eight mutations have been identified and include a deletion/insertion event, a nonsense mutation and missense/silent mutations. These primers may be used in the diagnosis and treatment of disorders involving factor XIII e.g. bleeding,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             products obtained for each exon of each individual were found to be of the expected size, indicating that there are no gross insertions or deletions in the facto XIII "a" gene of these patients. Three mutations which may be the cause of "a" subunit deficiency have been described. The first is a two base pair deletion at a splice donor acceptor site. This deletion does not grossly affect the splicing of the factor XIII pre mRNA, but causes a translational frameshift resulting in early
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAT28903-32 are primers which were used in the amplification of the exons of the factor XIII "a" gene. This allows analysis of the factor XIII gene and identification of differences in gene sequence which are known to segregate with a reduction or enhancement of factor XIII activity. All fifteen exons were amplified from five unrelated families showing factor XIII disorders. The PCR from the contract of the factor XIII activity and factor XIII disorders.
   AAT33418 standard; cDNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer; amplification; factor XIII "a" gene; deletion;

The synthetic oligonucleotides contain phosphorothicate linkages and essentially consist of 2'-O-alkylated ribonucleotides. Inhibiting the expression of VEGF is useful in the treatment of hypoxia induced neovascularisation and angiogenesis associated disease states, retinopathy of prematurity, diabetic retinopathy and age related macular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human vascular endothelial growth factor anti:sense oligo:nucleotide - inhibits the expression of VEGF, useful in treatment of hypoxia induced neovascularisation and angiogenesis associated disease states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      02-MAR-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT33371-T33431 are antisense oligonucleotides used to inhibit the expression of human vascular endothelial growth factor (VEGF). The synthetic oligonucleotides contain phosphorothicate linkages and essentially consist of 2'.O-alkylated ribonucleotides. Inhibiting the expression of VEGF is useful in the treatment of hypoxia induced neovascularisation and angiogenesis associated disease states, retinopathy of prematurity, diabetic retinopathy and age related macular
                                                                                                   Neovascularisation can be reduced by blocking vascular endothelial g factor (VEGF) expression using a synthetic oligonucleotide specific VEGF. Inhibiting neovascularisation is useful for treatment of retinopathy of prematurity, diabetic retinopathy and age-related mac degeneration. The present sequence is an example of a suitable oligonucleotide specific for human VEGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT48412 standard;

                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                      factor (VEGF) expression using a synthetic oligonucleotide specific for VEGF. Inhibiting neovascularisation is useful for treatment of retinopathy of prematurity, diabetic retinopathy and age-related macular degeneration. The present sequence is an example of a suitable oligonucleotide specific for human VEGF

Inhibiting neovascularisation useful for treatment of retinopathy of prematurity, diabetic retinopathy and age-related macular degeneration. The present sequence is an example of a suitable oligonucleotide specific for human VEGF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85587 to AAV85822 represent exon primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNB primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cyrckine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

AAV51705-V52008 are reverse PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution o

to trace the progeny of proprietary

                                                                                                                                                                               AAV35061-V35101 are primers which have a sequence complementary to the translation initiation or termination region of a nucleic acid encoding a P-glycoprotein associated with multiple drug resistance (MDR) and inhibite expression of the glycoprotein. These primers are composed of 8-30 covalently linked nucleotides and includes at least 1 of the following, a 2'-modification, a lipophilic group (IG) that improves cellular uptake, and at least 1 covalent link that is a phosphorothioate, phospho di- or tri-ester, methylphosphonate, methylene (methylinino), morpholino, polyamide, short chain alkyl or heteroatomic inter-sugar link, or cycloalkyl or heterocyclic inter-sugar link. The primers are used to modulate human MDR gene expression in cells and tissues, i.e. to improve chemotherapeutic treatment of an animal with hyper-proliferative disease, particularly cancer, to prevent development of MDR and to re-
                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-sense oligo:nucleotide(s) targetted to multiple drug resistance gene - are modified by lipophilic substituent, on sugar and-or with non-natural linkages, used to improve activity of anti-proliferative agents

                                                                                                                     AAV70042 to AAV70052 represent antisense oligonucleotides which are specifically hybridisable with a region of a nucleic acid encoding rat cross protein. The antisense compound regulates the expression of the c-Fos protein. The present invention also describes antisense oligonucleotides which regulate the c-Jun protein. The antisense oligonucleotides are used for the diagnosis and treatment of diseases or disorders associated with Activating Protein 1 expression, of which c-Fos and c-Jun are subunits. The antisense oligonucleotides are used in compositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease
                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotides regulating Activating Protein hybridise with c-fos and c-jun mRNA, used for regulating cycle expression and hyperproliferative disease.
                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                   CC AAV22531-89 represent antisense oligonucleotides which are targeted against the mRNA of the R1 subunit sequence of ribonucleotide reductase. CC Aberrant expression of the R2 gene, which encodes the second subunit of the ribonucleotide reductase gene, can determine the malignant contracteristics of cells. Suppression of R2 and R1 gene expression was CC found to reduce transformed properties of tumour cells. The antisense collgonucleotides can be used for modulating tumour cell growth, or for CC inhibiting tumour cell proliferation. They can also be used for CC increasing the sensitivity of neoplastic cells to chemotherapeutic drugs CC especially to hydroxyures, methotrexate (MTX), and pALA). The antisense coligonucleotides may be used to treat proliferative disorders including CC enter, papillomas, sarcomas, methodromas, various other forms of CC cancer, papillomas, sarcomas, methodromas, various other forms of CC cancer, papillomas, arthroscolarosis, psortassis, polythemia, mastocytosis, autonimune diseases, anglogenesis, bacterial infections and viral confections (including HIV hepatitis, or herpes infections)

can act as human prostate cancer markers are provided in the specification. The specification also provides methods for identifying markers for human prostate cancer and for detection of prostate cancer cells. The markers can be identified by amplifying human prostate RNA to provide nucleic acid amplification products, separating the products and identifying those RNA that are differentially expressed between human prostate cancers versus normal or benign human prostate. Prostate cancer cells in a sample can be detected by detecting a nucleic acid in a sample, the nucleic acid being a prostate cancer marker. Primers and probes derived from this marker can be used for the detection of prostate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This primer is used in the relative quantitative RT-PCR to exami expression of the genes which is used for the identification of of human prostate cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods for diagnosing prostate cancer or benigr prostatic hyperplasia cells in a biological sample. The method uses oligonucleotides specific for marker genes associated with tumour differentiation and progression in Reverse Transcription Polymerase Chair Reaction (RT-PCR) analysis. The methods are diagnostic techniques useful for detecting and monitoring the progression of benign prostatic hyperplasia and human prostate cancer (the most prevalent form of cancer and a major cause of death in males) prior to the tumor undergoing metastasis, therefore allowing the optimal method of treatment to be determined before the condition becomes life threatening
                                                                                                                                                                                                                                   Osteopontin; antisense; restenosis; coronary arterial tissue; CASMC; inflammation; coronary artery smooth muscle cell; angioplasty; human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing prostate cancer and benign prostatic hyperplasia cells - using oligonucleotide probes specific for marker genes associated with tumor differentiation and progression in Reverse Transcription Polymerase Chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense osteopontin oligonucleotide sequences which are complementary to at least a portion of the human osteopontin (OPN) cDNA sequence (AAX29191). The antisense sequences are used to prevent restenosis in tissue, particularly coronary arterial tissue, especially where the patient is undergoing angioplasty, particularly percutaneous trans-luminal coronary angioplasty or directional coronary atherectomy. They prevent secretion of osteopontin by monocytes and macrophages which infiltrate to sites of inflammation following surgery. Osteopontin probably causes restenosis by inducing coronary artery smooth muscle cells (CASMC) to migrate to, and proliferate at, angioplasty injury sites. The present sequence represents a probe specific for human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example
           against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as
                                       PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-X37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also
                                                                                                                                                                                WPI; 1999-371125/31.

                                                                                                                                                    PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY3673-4-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, peridpymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                           PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY3673-437349) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, pendymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

These ORFs encode polypeptides (see AAY36734-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY3673-4-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as mongonococcal uretritis, penitaly in breast feeding infants, and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                 Synthetic.
Chlamydia trachomatis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Griffais R,
     AAX91991-X97517 represent PCR primers used to amplify open reading and other nucleic acid sequences from the genome of Chlamydia pneum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
This sequence is an antisense oligonucleotide that specifically hybridises to nucleic acids encoding a human multidrug resistance P-glycoprotein (MDR1). The oligonucleotide inhibits expression of the P-glycoprotein, which functions as an ATP driven efflux pump. The antisen oligonucleotides of the invention have a phosphorothioate modified backbone, and may contain residues with 2' modifications selected from methoxyethoxy, 2'-fluoro, 2'-O-fluoro or 2'-propyl. Some antisense oligonucleotides have cholesterol bound at the 3' end which ensures resistance to 3' exonucleases, enhances cellular uptake, and leaves the 5'terminus available for conjugation of additional functional groups. To oligonucleotides may be used in research, diagnosis or as therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (see AXX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinustitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                    Antisense oligonucleotide specific for multidrug resistance P-
glycoprotein is useful for treating hyperproliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 8 A; 5 C; 5
                                                                                                                                                                                                                                                                                                                 Manoharan M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-MAR-1999;
08-JUN-1999;
The invention relates to the human ABC1 cholesterol transporter protein (B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is a member of the ATP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly intracellular cholesterol trafficking in monocytes and fibroblasts, being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ATP-binding cassette; HDL deficiency disorder; high density liporangier disease; TD; familial HDL deficiency; FHA; polymorphism; cardiovascular disease; coronary artery disease; coronary rester
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene expression can be used to treat hyperproliferative diseases and disorders e.g. cancer, in conjunction with chemotherapeutic reagents to prevent or modulate the development of multidrug resistance during the treatment. The oligonucleotides can also be used to resensitize hyperproliferative MDR cells in an animal previously exposed to chemotherapeutic agents. Radiolabelled oligonucleotides can be used to perform autoradiography of tissues to determine localization,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         distribution and quantitation of MDR P-glycoproteins diagnostic purposes
                                                                                                                                                                                                                                                                              WPI; 2000-587528/55

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC disease, particularly coronary artery disease, but also cerebrovascular CC disease, coronary restenosis, and peripheral vascular disease. CC Conversely, a high level of HDL has protective effects against CC Cardiovascular disease. The invention provides genetic constructs and cardis and methods of gene therapy for the treatment or prevention of CC cardiovascular disease comprising the administration of an expression cC cardiovascular disease comprising the administration of an expression cC encompasses compounds which mimic ABC1 activity, compounds which CC stimulate ABC1 expression and methods of screening for such compounds. It further relates to methods for determining whether a patient has an CC abc1 gene. Human ABC1 proteins and nucleotides can be used to treat or prevent cardiovascular disease, especially coronary artery disease, cerebrovascular disease, especially coronary artery disease associated CC with ABC1 biological activity, such as Alzheimer's disease associated with ABC1 biological activity, such as Alzheimer's disease, and the exact sequence as GenBank Accession No: AJ012376.1. The invention specifically excludes proteins with the exact amino acid cand with the exact sequence as GenBank Accession No: AJ012376.1. The CC present sequence represents a human ABC1 gene PCR primer which may be used to amplify an exon of the human ABC1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The gene encoding Abla Located on chromosome 9q31, and mutations in this gene are associated with two genetic HDL (high density lipoprotein) deficiency disorders, Tangjer disease (TD) and familial HDL deficiency (FHA). These diseases are distinguishable in that TD is an autosomal recessive disorder, while FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular cholesterol".

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC PCR primers AAA96415-16 were used to amplify polymorphic microsatellite crepeat (PMR) sequences from the human costimulatory receptor gene locus (hCGRI). The primers are used in the method of the invention. The specification describes a method for determining the predisposition of a pure subject to develop autoimmune disease. The method comprises contexting a pure sequence in the CD28, ICOS gene or CTIA4 gene of the chuman costimulatory receptor gene locus (hCGRI). PMR sequences vary in congrishment of the products and can be amplified to generate products that congrished the products can then be detected by rapid and convenient high resolution processes. The method is useful for convenient high resolution processes. The method is useful for convenient high resolution processes. The method is useful for convenient disease, craves disease, autoimmune hypothyroidism, compasthenia gravis, thymoma, lupus, thyroiditis, postpartum thyroiditis, convenient agravis, thymoma, lupus, thyroiditis, postpartum thyroiditis, conveniences within hCRGL are useful as markers in a variety of assays convenience within hCRGL are useful as markers in a variety of assays convenience within hCRGL are useful as markers in a variety of assays convenience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides nucleic acid markers of prostate, breast and CC bladder cancer. The markers are indicators of malignant transformation of CC prostate, breast and bladder tissues and are diagnostic of the potential CC for metastatic spread of malignant prostate tumours. The nucleic acid can also be used as targets for therapeutic intervention in prostate cancer. CC banign prostatic hyperplasia (BPH), bladder cancer or breast cancer. The markers may be used to design specific probes and primers, for the rapid CC analysis of prostate, bladder or breast biopsy samples. The probes and cprimers may also be used for in situ hybridization or in situ PCR CC detection and diagnosis. They may also be used to identify and isolate CC full length gene sequences form various DNA libraries. Antibodies against the polypeptide products of the markers can be used to treat prostate CC cancer, bladder cancer or breast cancer. The encoded proteins may be used to detect antibodies. The proteins and antibodies can be used in concerts, and for clinical diagnosis of these cancers. The antibodies may also be used for radioimaging to quantify and localize the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of a nucleic acid (AAA11284) coding for a transmembrane protein TRPC7 (AAY92944) which is expressed in brain and is homologous to transient receptor potential (TRP) protein. This suggests that the TRPC7 protein may have a calcium channel function. The genomic sequence has been shown to contain 31 introns. This sequence represents an exon/intron junction from the genomic TRPC7 sequence. The DNA and protein can be used in the diagnosis and treatment of disorders associated with TRPC7, especially the screening, monitoring and treatment (by gene therapy) of periodic psychosis, which appears to be associated with mutations in the TRPC7 gene
                                                                                                                                                                                                                                                                                                                                                  Human genome, biallelic marker; high density disequilibrium map, genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                               The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immuno: IL-5 receptor-alpha; asthma; eosinophilic syndron

                                                                                   Query Match
                                                                                                                                       The present sequence is one of a large number of antisense oligonucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides containing a central gap region consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The oligonucleotides have a phosphorothioate backbone and the cytidine residues in the 2'-MOE wings are 5-methylsytidines. The fra-1 antisense oligonucleotides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research respects and in kits. Use of the antisense prophylaxis and as research respects and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                Novel antisense compound 8-30 nucleobases in length targeted to human -1 and which specifically hybridizes with and inhibits the expression human fra-1, useful for modulating the expression of fra-1 in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is an antisense oligonucleotide directed against the mRNA encoding the R1 component of mammalian ribonucleotide reductase. Ribonucleotide reductase catalyses the conversion of ribonucleotides to their corresponding decoxyribonucleotides and thus plays an important role in DNA synthesis and cell proliferation. Regulation of ribonucleotide reductase is altered in cultured malignant cells and increased levels of R2 protein and R2 mRNA have been found in pre-malignant and malignant tissues as compared to normal control tissue samples. The present antisense sequence is therefore useful for inhibiting tumourigenicity of neoplastic cells and inhibiting metastasis of tumour cells. It is also useful for increasing sensitivity of neoplastic cells to chemotherapeutic drugs, thus allowing chemotherapeutic treatments to be used in patients who have become resistant or less sensitive to chemotherapy. The sequence may be RNA or DNA and may comprise a modified backbone and/or nucleotide analonies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA6642. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New radiation hybrid map of the dog, Canine familiaris, for e.g. identifying genes implicated in phenotypic and or in genetic diseases and for studying dog pedigrees.

The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases

cc which inhibits expression of IGFBP-5 by hormone-regulated tumour cells.

Cc The compositions is useful for delaying progression of hormone-regulated tumour cells such as prostatic cancer cells or breast cancer cells, to an androgen-independent state, by treating hormone sensitive tumour cells.

Cc with the antisense sequence which inhibits expression of IGFBP-5 by the tumour cells. The composition can also be used for treating a hormone-cc responsive cancer in an individual, and administering the composition to the individual after initiation of hormone-withdrawal to induce apoptotic cell death of hormone-responsive tumour cells, and therefore delaying the progression of hormone-responsive cancer cells, and therefore delaying the composition of also be used for inhibiting or delaying the metastatic boney progression of an IGF-1 sensitive tumour in a mammal, by administering the composition to inhibit the expression of IGFBP-5 by the hormone-responsive cancer cells, and therefore inhibiting or delaying composition to inhibit the expression of IGFBP-5 by the hormone-responsive cancer cells, and therefore inhibiting or delaying composition to inhibit the expression of IGFBP-5 by the hormone-responsive cancer cells, and therefore inhibiting or delaying composition to inhibit the expression of IGFBP-5 by the hormone-responsive cancer cells, and therefore inhibiting or delaying composition of the tumour 8888888888888888888888888888888

Novel isolated and purified bovine useful in medical, pharmaceutical, useful in vaccine, and for treating autoimmune disorders, infections or porcine collagens and gelatins food and cosmetic industries, as and cancer.

Example 1; Page 56; 168pp; English.

The present sequence is a PCR primer used for amplifying the coding region of human alphal(I) collagen gene. The present invention relate recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, grafts, drug delivery system, dermal implants, haemostats, and incontinence implants, and for tracking autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as sau coding on relates sausage ö

This sequence represents an antisense oligonucleotide targeted agains human insulin-like growth factor binding protein-5 (IGFBP-5). The invention relates to a composition for treatment of hormone-regulated cancer, comprising an antisense oligonucleotide (such as this sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 casings, and in cosmetics or facial and skin products such as moisturisers. Recombinant gelatin is useful in vaccine formulations for treating viral infections, autoimmune diseases and cancer. Gelatin is useful in the manufacture or as a component of various pharmaceutical an medical devices and products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various manufacturing processes, as a light-sensitive coating in various electronic devices, as photoresist base in photolithographic processes, in printing and photographic applications, in laboratory application, an as a component in various gels used for biochemical and electrophoretic
                     clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                                                                                                                                          WPI; 2001-524255/58
                                                                                                                                                                                                                                                                                       Wakamatsu

                                                                                                                This sequence is a sequencing primer for the human CP2/LSF/LBP-1 gene ARNm. The invention relates to a method for predicting an increased risk of a human subject of developing Alzheimer's disease, comprising assaying for a mutation within the ADN sequence of the CP2/LSF/LBP-1 gene including the region controlling the expression of the gene. The method is useful for predicting an increased risk of a human subject of developing Alzheimer's disease. Transgenic animals containing sequences from the CP2/LSF/LBP-1 gene are useful for screening for drugs capable of

The method involves preparing an antisense oligonucleotide capable of inhibiting mRNA expression of target mRNA sequences, as well as antisense oligonucleotides capable of binding DNA. The antisense and antisense libraries are useful for preparing therapeutic agents for the treatment of genetic disease. The present DNA sequence is human Bcl-2 protein target DNA related to the invention. Note: The present sequence is shown as DNA in the specification; however, in vivo,

                                                                                                                                              human interleukin-13 (III3), and describes the single nucleotide polymorphisms (SNPs) found within the gene, which is found on chromoson 5q31. II13 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of asthma and other immune and inflammatory diseases. The III3 sequences and the SNPs identified can be used in drug screening, t determine an individual's susceptibility to disease, in forensic and paternity testing, and to identify treatments for cancer, immune and inflammatory diseases, including asthma and diseases characterised by
                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide comprising single nucleotide polymorphisms in human interleukin-13 gene is useful for studying expression and function of interleukin-13, as well as diagnosing and treating cancer, inflammatory, and immune disorders.
                                                                                                   Sequence 20
                                                                                                                                                                                                                                                                                  The present invention provides the protein,

IL13 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of asthma and other immune and inflammatory diseases. The IL13 sequences and the SNPs identified can be used in drug screening, to sequences and the SNPs identified can be used in forensic and informatic and sequences and the SNPs identified can be used in forensic and individual's susceptibility to disease, in forensic and
The sequence represents nucleic acid biomarker UC band 201 primer #2, used in detection of prostate, breast and bladder cancer. Biomarker nucleic acid sequences can be used as hybridisation probes and primers that specifically hybridise to prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer markers. Proteins encoded by the nucleic acid markers can be used to produce antibodies for the detection of prostate, breast or bladder cancer. The nucleic acids can be used as targets for therapeutic intervention in these diseases, in the identification and isolation of full-length gene sequences, including regulatory elements for gene expression, from genomic human DNA libraries, as hybridisation probes for screening genomic chuman DNA libraries. The kits comprising the nucleic acid sequences are useful for detecting bladder, breast or prostate cancer cells in a biological sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            31-JUL-1995;

Novel oligonucleotide sequences of internal transcribing spacer region non-tuberculosis mycobacteria (NTM) used as probes or primers for detecting and identifying mycobacteria and distinguish TB complex from of f

27; Page 65; 89pp; English

The present sequence is an oligonucleotide developed using a CC Mycobacterium ITS (internal transcribed spacer region) nucleotide CC sequence. ITS DNA sequences from M. fortuitum, M. chelonae, M. abscessus, CC M. vaccae, M. flavescens, M. asiaticum, M. porcinum, M. acapulcensis, M. CC diernhoferi genes were identified. The oligonucleotides derived from CC these sequences were used to develop PCR primers and hybridisation probes for detection and identification of Mycobacterium. ITS has a more CC polymorphic region than 16S rRNA and also has a conserved region. It is therefore highly effective as a target DNA for distinction of genotype. CC therefore highly effective as a traced to solid substrate, hybridise only considered indentify the specific mycobacteria, and thus they CC with nucleotide sequences in ITS of specific mycobacteria, and thus they can detect and identify the specific mycobacteria sensitively. The CC can detect and identify the specific mycobacteria mycobacteria coligonucleotide can also detect and identify the specific mycobacteria. CC by PCR amplification. Using the oligonucleotide primers or probes made CC from ITS of mycobacteria, it is possible to detect mycobacteria,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to antisense compounds up to 30 nucleobases in length targeted to a E2F transcription factor 1 The invention is useful for inhibiting the expression of E2F transcription factor 1 in cells or tissues. The antisense oligonucleotides may also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compound capable of inhibiting the expression of E2F transcription factor 1, useful for preventing or delaying infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-190981/19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-MAR-2000; 2000US-00517584
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  02-MAR-2000; 2000US-00517584
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human E2F transcription factor 1 antisense oligonucleotide #69

                                                                                                                                                                                                                                                                                                                                                                                                                                    example from field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to new Xanthomonas campestris bacteria strains made non-virulent by inactivation of at least one virulence gene but which have retained the capacity to produce exo-polysaccharides (preferably xanthan gum). One such virulence gene deleted to produce the bacterial strains was the hrpC2 gene (Hypersensitive Reaction and Pathogenicity). The hrp genes are essential for pathogenicity in plants. The present sequence is a PCR primer used to clone the hrpC2 gene in an example from the invention. (Updated on 11-SEP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Xanthomonas campestris bacteria strains for use in production of exopolysaccharides are made non-virulent by inactivation of at least one

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense nucleotide targetted to the mouse Gob-5 gene (coding sequence shown in AAH46101) or its human counterpart, the CLCA1 gene (coding sequence shown in AAH46102). The invention also relates to an antibody specific for the Gob-5 protein, medical and diagnostic compositions containing the antisense nucleotide or the antibody, and methods and kits for screening for compounds which inhibit the protein. Gob-5 and CLCA1 are proteins expressed by goblet cells. The antisense oligonucleotides and antibody are therefore useful for the treatment and prevention of bronchial asthma and chronic obstructive pulmonary disease. Sequences AAH46135-AAH46136 represent primers used in an exemplification of the invention to sequence human CLCA1 cDNA
              New antisense nucleotide, useful for treatment and prevention bronchial asthma and chronic obstructive pulmonary disease.
